

Ideation Phase

Brainstorm & Idea Prioritization Template

Date	22 June 2026
Name	M Manosika
Project Name	Automated Network Request Management System
Maximum Marks	4 marks

Step 1: Team Gathering, Collaboration, and Selection of the Problem Statement

Team Gathering & Collaboration Approach

Our team conducted a series of brainstorming and discussion sessions to identify common challenges faced by organizations in managing network service requests. We analyzed the existing request handling process followed by IT support teams and evaluated several scenarios where automation could improve efficiency, accuracy, and service quality. After comparing different IT service management use cases, the team selected the Automated Network Request Management System as the project topic because network-related requests are frequently raised within organizations and often involve multiple approval and execution stages. Automating this process using ServiceNow can significantly improve operational efficiency and service delivery.

Selected Problem Statement

The team identified that the traditional process of handling network service requests relied heavily on manual communication methods such as emails, spreadsheets, and verbal approvals. This manual approach created several operational challenges, including:

- **Incomplete Request Information:** Employees frequently submitted network requests with missing details such as device information, network location, or request type. This resulted in repeated follow-ups from the IT support team and delayed request processing.
- **Limited Workflow Visibility:** The absence of an automated approval mechanism made it difficult to monitor the status of requests. Managers and IT teams had limited visibility into pending approvals, causing unnecessary delays in request fulfillment.
- **Inconsistent Request Tracking:** Request details were maintained manually using spreadsheets or shared documents, increasing the possibility of duplicate records,

incorrect data entry, and loss of request history. This affected service quality and made auditing and reporting difficult.

Step 2: Brainstorm, Idea Listing, and Grouping

Group A: User Portal & Request Form

- Idea 1: Develop a self-service Network Request Catalog Item using the ServiceNow Service Catalog, allowing employees to submit network-related requests through a centralized portal.
- Idea 2: Configure mandatory input fields such as Employee Name, Department, Request Type, Device Details, Network Location, and Business Justification to ensure complete and accurate request information.
- Idea 3: Implement dynamic catalog variables and UI Policies to display additional fields only when required, providing a simple and user-friendly request form.

Group B: Workflow Automation & Approval Process

- Idea 4: Design an automated approval workflow using ServiceNow Flow Designer to route submitted requests to the respective reporting manager for review and approval.
- Idea 5: Configure automatic email notifications to inform employees, managers, and the IT support team about request submission, approval, rejection, and completion.
- Idea 6: Apply workflow conditions to ensure that network provisioning tasks are generated only after the request has been approved, preventing unauthorized service execution.

Group C: Task Management & Request Tracking

- Idea 7: Automatically generate network provisioning tasks for the IT Network Administration team after managerial approval.
- Idea 8: Maintain all request records, approval history, assigned tasks, and request status within the ServiceNow platform, enabling complete request lifecycle tracking, reporting, and future auditing.

Step 3: Idea Prioritization

To identify the most effective solution, the team evaluated each proposed idea based on two important factors: the effort required for implementation and the operational benefits it would provide. The selected solutions were then prioritized using an Action Matrix to determine which features should be included in the final system.

Selected Solution Concept	Implementation Complexity (Effort)	Operational Impact (Benefit)	Priority Decision
Network Request Catalog with	Low – Requires basic catalog item creation and mandatory	High – Ensures all required request information is captured	High Priority – Selected as the foundation of the request

Selected Solution Concept	Implementation Complexity (Effort)	Operational Impact (Benefit)	Priority Decision
Mandatory Fields	variable configuration.	accurately before submission, reducing incomplete requests.	submission process.
Dynamic UI Policies for Request Form	Low – Uses client-side conditions to display relevant fields based on the selected request type.	High – Simplifies the request form and improves user experience by displaying only necessary information.	High Priority – Implemented to create a clean and user-friendly interface.
Automated Manager Approval using Flow Designer	Medium – Involves designing approval workflows and configuring approval conditions.	High – Eliminates manual approval tracking and speeds up the request approval process.	High Priority – Adopted as the core workflow automation component.
Automated Task Creation for Network Support Team	Medium – Requires task generation and assignment rule configuration within the workflow.	High – Automatically assigns approved requests to the network administration team, reducing manual effort.	High Priority – Included to improve operational efficiency and task management.
Request Tracking within ServiceNow Tables	Medium – Utilizes standard ServiceNow request and task records for maintaining request history.	High – Provides complete visibility of request status, approvals, and task progress throughout the request lifecycle.	High Priority – Adopted to support monitoring, reporting, and auditing.

Selected Solution Concept	Implementation Complexity (Effort)	Operational Impact (Benefit)	Priority Decision
Email Notification Alerts	Low – Uses built-in notification capabilities to send status updates.	Medium – Keeps employees, managers, and IT teams informed about request progress, improving communication.	Medium Priority – Implemented as a supporting feature to enhance user awareness and transparency.

Final Prioritized Solution

Based on the evaluation, the team selected a combination of ServiceNow Service Catalog, Dynamic Form Validation, Flow Designer Approval Workflow, Automated Task Creation, Request Tracking, and Email Notifications. These features together provide a complete, efficient, and automated Network Request Management System that reduces manual effort, improves data accuracy, and enhances overall service delivery.
