

Project Design Phase – II

Solution Requirements (Functional & Non-Functional)

Date	23 June 2026
Name	M Manosika
Project Name	Automated Network Request Management System
Maximum Marks	4 Marks

Functional Requirements

The following functional requirements describe the major features and system capabilities required for the successful implementation of the **Automated Network Request Management System**.

FR No.	Functional Module	Functional Description
FR-1	Network Request Submission	• Allow employees to access the Network Request Catalog through the Service Portal. • Automatically retrieve employee profile details during request creation. • Display request forms based on the selected network request category.
FR-2	Dynamic Form Behavior	• Show relocation-specific fields only when the request type is Relocation. • Hide unnecessary network configuration fields for standard connection requests. • Improve form usability by displaying only relevant information.
FR-3	Approval Workflow Automation	• Route submitted requests automatically to the reporting manager using Flow Designer. • Send email and portal notifications for approval actions. • Update request status dynamically as Requested, Approved, or Rejected.
FR-4	Request Processing & Data Management	• Generate network provisioning tasks after manager approval. • Store approved request information in the u_network_database table. • Maintain complete request history for future tracking and reporting.

Non-Functional Requirements

The following non-functional requirements define the quality standards expected from the proposed solution.

NFR No.	Quality Attribute	Requirement Description
NFR-1	Usability	The application should provide a simple, intuitive, and user-friendly interface. Request forms should load quickly and be easy to understand, reducing user errors during submission.
NFR-2	Security	The system should implement role-based access control to ensure that only authorized users can view, approve, or modify request information. Sensitive records must be protected using ServiceNow ACLs.
NFR-3	Reliability	The solution should validate request data before processing and ensure that only accurate and complete information is stored in the database.
NFR-4	Performance	Request forms, approval workflows, and background processes should execute efficiently to minimize processing time and improve user experience.
NFR-5	Availability	The application should remain accessible during business hours, ensuring uninterrupted access to network request services whenever required.
NFR-6	Scalability	The system should support increasing numbers of network requests and future organizational growth without affecting overall system performance.
