Proposed Solution

The Automated Network Request Management System is designed to replace the traditional manual process of handling network service requests with a centralized and automated solution on the ServiceNow platform. Instead of depending on emails, spreadsheets, and manual tracking, employees can submit network-related requests through a self-service portal.

The solution automates request validation, manager approvals, task assignment, and database updates. This minimizes manual effort, improves data accuracy, shortens processing time, and enables the IT team to deliver network services more efficiently.

S.No	Parameter	Description
1	Problem Statement	Employees currently experience delays and inefficiencies while requesting network services due to manual request handling, email-based approvals, and lack of centralized tracking. Incomplete request information and manual data entry increase processing time and the possibility of errors,

S.No	Parameter	Description
		affecting business operations during network setup or office relocation.
2	Solution Description	The proposed solution introduces a centralized ServiceNow application that enables employees to submit network requests through the Service Portal. Client Scripts automatically populate employee details, UI Policies dynamically display relevant fields, and Flow Designer automates manager approvals, notifications, and task creation. Approved requests are securely stored in the u_network_database table for future reference and reporting.
3	Innovation / Uniqueness	Unlike conventional manual request systems, this solution combines intelligent form validation, automated approval workflows, and centralized data management within a single platform. Dynamic field visibility, automatic profile retrieval, and workflow automation improve request accuracy while reducing manual intervention throughout the request lifecycle.
4	Customer Benefits	Employees benefit from a simple and transparent request process with real-time status updates and faster service delivery. The solution reduces confusion, minimizes approval delays, and improves overall satisfaction by providing a reliable and user-friendly network request management system.

S.No	Parameter	Description
5	Business Value	Automating the request lifecycle reduces administrative effort, minimizes operational delays, and improves the productivity of the IT Infrastructure team. By eliminating repetitive manual tasks, technical staff can focus on network implementation and maintenance activities, improving overall organizational efficiency.
6	Scalability	Since the solution is developed on the ServiceNow cloud platform, it can efficiently support increasing numbers of users, departments, and network requests. The modular architecture also allows future enhancements, such as integrating additional IT service requests and expanding to multiple organizational locations without affecting system performance.
